

Brief guide for using the state-space model

Content

Name of used R and stan files

(state_space_model_with_logistic.R)

(state_space_model_with_logistic.stan)

- Install and download (slide: 2 ~ 3)
- Import wastewater-based data (slide: 4 ~ 9)
- Set prior distribution (slide 10)
- Implement analysis (slide 11 ~ 13)

Name of used R and stan files

(state_space_model_with_logistic_highspeed.R)

(state_space_model_with_logistic_highspeed.stan)

- High speed analysis

Contact: hirokiando@arizona.edu

- Install “R” and “Rstudio”

<https://rstudio-education.github.io/hopr/starting.html>

- Download R file, csv file, and stan file from the github.

Raw Download

```

1
2 getwd() #check where you should upload csv file analyzed
3
4 install.packages("dplyr")
5 install.packages("tidyr")
6 install.packages("plyr")
7 install.packages("ggplot2")
8 install.packages("rstan")
9 install.packages("stats")
10 install.packages("bayesplot")
11
12 library(dplyr)
13 library(tidyr)
14 library(plyr)
15 library(ggplot2)
16 library(rstan)
17 library(stats)

```

- Open the CSV file downloaded in your laptop
- Input wastewater-based data in the template CSV file

14 library(plyr)
15 library(ggplot2)
16 library(rstan)
17 library(stats)
18 library(bayesplot)
19
20 threshold <- 0.8 #threshold for detection rate to select data on quantified concentration
21 data_1 <- read.csv("template_file.csv") #change the name of csv file
22
23
24
25 data <- data_1
26 data <- data %>% mutate(log_concentration = log10(concentration))
27 data <- data %>% mutate(date = as.Date(date))
28 data <- data %>% select("date", "number_of_tested_samples", "number_of_positive_samples", "concentration", "log_concentration")
29 colnames(data) <- c("date", "count", "positive", "concentration")
30
31
```

2. Click

Run

Note: You no longer need to repeat this process once the packages are installed.

- Upload library used in the analysis

RStudio interface showing R code for installing and loading libraries. The code is as follows:

```
1 getwd() #check where you should upload csv file analyzed
2
3
4 install.packages("dplyr")
5 install.packages("tidyr")
6 install.packages("plyr")
7 install.packages("ggplot2")
8 install.packages("rstan")
9 install.packages("stats")
10 install.packages("bayesplot")
11
12
13
14 library(dplyr)
15 library(tidyr)
16 library(plyr)
17 library(ggplot2)
18 library(rstan)
19 library(stats)
20 library(bayesplot)
21
22 threshold <- 0.8 #threshold for detection rate to select data on quantified concentration
23 d <- read.csv("template_file.csv") #change the name of csv file
24
25
26
27 data <- data_1
28 data <- data %>% mutate(log_concentration = log10(concentration))
29 data <- data %>% mutate(date = as.Date(date))
30 data <- data %>% select("date", "number_of_tested_samples", "number_of_positive_samples", "log_concentration")
31 colnames(data) <- c("date", "count", "positive", "concentration")
32
33
34
35 #state-space model with logistic
36 data_stan <- data
37 data_stan <- data_stan %>% mutate(positive_rate = positive/count)
38 sample_size <- nrow(data_stan)
39
```

Annotations:

- 1. Drag (points to the library loading code block)
- 2. Click (points to the Run button)

- Set arbitrary threshold (0.7 ~ 1.0)
- Import data

```

1 getwd() #check where you should upload csv file analyzed

17	2022/1/17	5	1	10151.7241
18	2022/1/18	5	1	7078.2516

- Prior distribution is important for convergence of parameters
(Prior distribution should be decided from available information)

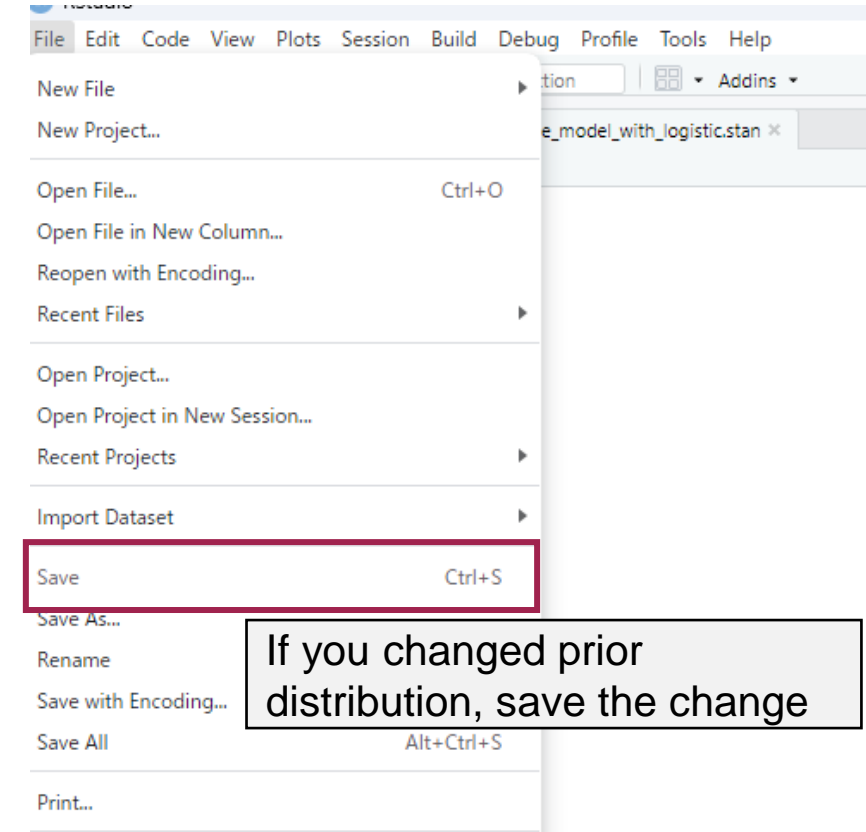

```

1 data {
2   int<lower=0> n_all;
3   int<lower=0> n_cd;
4   int<lower=0> n_d;
5   vector[n_d] ww;
6   int<lower=0> nd[n_cd];
7   int<lower=0> n_count[n_cd];
8   int row_d[n_d];
9   int row_cd[n_cd];
10 }
11
12 parameters {
13   vector[n_all] mu;
14   real<lower=0> s1;
15   real<lower=0> s2;
16   real c1;
17   real<lower=0> c2;
18 }
19
20 model {
21   int x1[n_cd];
22   int x2[n_d];
23   real p[n_all];
24
25   // Priors
26   mu ~ normal(3, 5); // C1a
27   s1 ~ normal(0, 1/5);
28   s2 ~ normal(0, 1.5);
29   c1 ~ normal(-10, 10); // C1b
30   c2 ~ normal(3, 5); // C2a
31 }

```

mu: log-transformed wastewater concentration (log10 copies/L)

- In the case of “mu”, prior distribution was set as a normal distribution with mean of 3 and standard deviation of 5 to cover typical wastewater concentration range (0 ~ 8 log10 copies/L)
- If average of wastewater concentration of a virus is known to be around 7 log10 copies/L, mean of prior distribution should be 7.

- S_1 is a parameter of the state-formula.
- S_2 is a parameter of the observation formula (i.e., measurement error).
- C_1 and C_2 are parameters of logistic function.

- Drag the row from 25-87 and click Run

```

82   FUN = quantile,
83   probs = c(0.025, 0.5, 0.975) #credible interval can be changed
84 )))
85
86 colnames(result) <- c("low", "median", "upr")
87 data_estimated_concentration <- cbind(data, result)

```

MCMC condition can be changed according to your data. (<https://mc-stan.org/rstan/reference/stan.html>)

- Check the convergence of parameters in the state-space model

```
> print(mcmc, pars = c("c1", "c2", "s1", "s2"), probe = c(0.025, 0.50, 0.975))
Inference for Stan model: anon_model.
4 chains, each with iter=4000; warmup=2000; thin=4;
post-warmup draws per chain=500, total post-warmup draws=2000.
```

	mean	se_mean	sd	2.5%	25%	50%	75%	97.5%	n_eff	Rhat
c1	-24.55	0.11	3.76	-32.08	-27.04	-24.37	-21.96	-17.60	1208	1.00
c2	8.04	0.03	1.18	5.82	7.21	8.01	8.82	10.39	1565	1.00
s1	0.04	0.00	0.01	0.02	0.03	0.04	0.05	0.07	272	1.02
s2	0.96	0.00	0.15	0.71	0.85	0.94	1.04	1.31	1805	1.00

- Rhat should be lower than 1.10 (<https://mc-stan.org/misc/warnings.html#bulk-ess>)
- N_eff should be higher than 400 (ideally, 1000)

To improve Rhat and n_eff

- Fix prior distribution
- Increase chain, iter (warmup), and thin
- Conduct re-parameterization (**Slide number 13 - 15**)

- Check the estimation of wastewater concentration

```

#figure
data_fig <- data_data_estimated_concentration
92 data_fig <- data_fig %>% mutate(posi = if_else(count < 1, "no", if_else(positive >= threshold*count, "yes", "no")))
93
94 plot <- ggplot(data_fig, aes(x = as.Date(date)))
95 plot <- plot + geom_point(aes(y = concentration, color = posi, shape = posi))

97 plot <- plot + scale_color_manual(values = c("#FEC44F", "#0570B0"))
98 plot <- plot + geom_ribbon(aes(ymin = low, ymax = upr), fill = "#3690C0", alpha = 0.3)
99 plot <- plot + geom_line(aes(y = median), color = "#0570B0", size = 1)
100 plot <- plot + labs(x = "Date", y = "wastewater concentration")
101 plot <- plot + scale_x_date(limits = c(as.Date("2022-01-01"), as.Date("2023-06-01")), date_breaks = "2 months", date_labels = "%b") #change the date
102 plot <- plot + scale_y_continuous(limits = c(2.0, 5.5), breaks = seq(2.0, 5.5, 1)) #change the scale of y axis
103 plot <- plot + theme_bw()
104 plot <- plot + theme(
105   axis.line = element_line(linewidth = 1.0, lineend = "square"),
106   text = element_text(colour = "black", size = 14),
107   legend.position = "none",
108   axis.ticks = element_line(linewidth = 1.0),
109   axis.ticks.length = unit(-2, "mm"))
110 plot
111
112

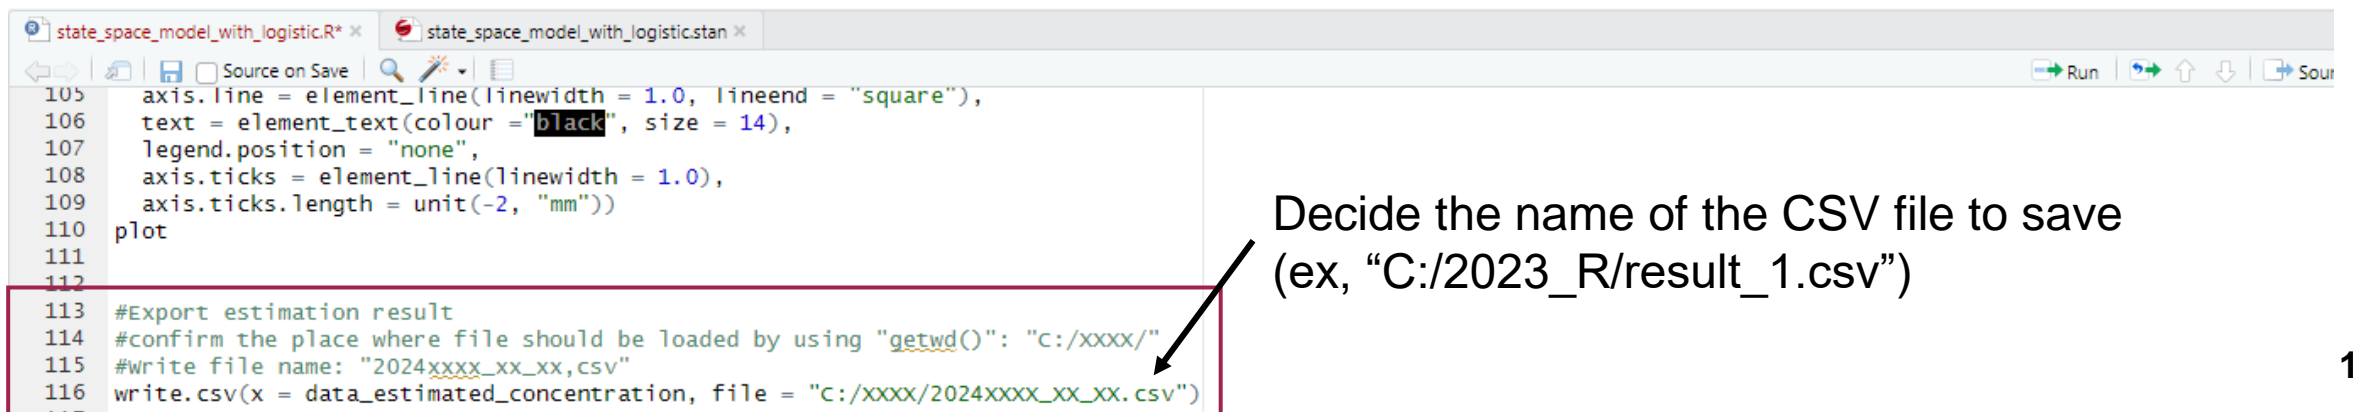

```

Change

- X axis (date)
- Y axis (log10 wastewater concentration)

https://ggplot2.tidyverse.org/reference/scale_continuous.html

- Export the result in CSV file

```

105 axis.line = element_line(linewidth = 1.0, lineend = "square"),
106 text = element_text(colour = "black", size = 14),
107 legend.position = "none",
108 axis.ticks = element_line(linewidth = 1.0),
109 axis.ticks.length = unit(-2, "mm"))
110 plot
111
112
113 #Export estimation result
114 #confirm the place where file should be loaded by using "getwd()": "c:/xxxx/"
115 #write file name: "2024xxx-xx-xx.csv"
116 write.csv(x = data_estimated_concentration, file = "c:/xxxx/2024xxx-xx-xx.csv")
117

```

Decide the name of the CSV file to save
(ex, "C:/2023_R/result_1.csv")

High speed analysis

- The above approach (file name: state_space_model_with_logistic.R & state_space_model_with_logistic.stan) require a lot of analytical time.
(上の方法では、解析時間が長いのが難点)
- This problem is solved by using re-parameterization approach.
(再パラメータ化というモデリング技術を使って、解析時間を短縮する)
 - https://mc-stan.org/docs/2_18/stan-users-guide/reparameterization-section.html
 - <https://mc-stan.org/docs/stan-users-guide/reparameterization.html>

71 )
72
73 print(mcmc, pars = c("c1", "c2", "s1", "s2"), probe = c(0.025, 0.50, 0.975))

```

R file is almost same, except for this line.

High speed analysis

- Re-parameterization enable to standardize prior distributions of parameters
(再パラメータ化では、全てのパラメータの事前分布のスケールを同一にする)

state_space_model_with_logistic_highspeed.stan (Stan file)

```

12 parameters {
13   vector<lower=-4, upper=4>[n_all] mu_raw;
14   real<lower=-4, upper=4> s1_raw;
15   real<lower=-4, upper=4> s2_raw;
16   real<lower=-4, upper=4> c1_raw;
17   real<lower=-4, upper=4> c2_raw;
18 }
19

```

Range of parameters

```

20 transformed parameters {
21   vector[n_all] mu;
22   for (i in 1:n_all) {
23     mu[i] = 3.5 + 1.5 * mu_raw[i];
24   }
25   real s1;
26   s1 = exp(s1_raw - 2);
27   real s2;
28   s2 = exp(s2_raw - 2);
29   real c1;
30   c1 = -22 + 5*c1_raw;
31   real c2;
32   c2 = 6 + 3*c2_raw;
33 }
34

```

Parameters are converted into reasonable scale values, which is expected from previous studies.

- In this case, typical range of wastewater concentration is expected to be 0.5 to 6.5 log₁₀ copies/L.
- Typically, S_1 and S_2 are positive values, ranging from 0 to 1.
- C_1 and C_2 are probably in this range, according to a previous study.

These values can be changed, according to your dataset.
(Do not forget to save file after changing values.)

```

40 model {
41   // Priors
42   mu_raw ~ normal(0, 1);
43   s1_raw ~ normal(0, 1);
44   s2_raw ~ normal(0, 1);
45   c1_raw ~ normal(0, 1);
46   c2_raw ~ normal(0, 1);
47
48   // Autoregressive prior for mu
49   mu[3:n_all] ~ normal(2 * mu[2:n_all-1] - mu[1:n_all-2], s1);
50

```

The same prior distribution

- 
- Run MCMC sampling from R file
 - Check R-hat and n_eff
 - Confirm wastewater concentration
